

Welcome to GitHub!

We are excited to host you in our Bellevue Hub this evening.

WiFi: GitHub Guest
Password: octocat11

Bellevue Hub Code of Conduct

- Keep it clean!
 - When in doubt, throw it out (in the trash)!
- Need something?
 - Ask a Community Manager or GitHub Employee!
- See questionable behavior?
 - Please notify a Community Manager or GitHub Employee!
 - e.g. Attendees wandering into restricted areas

HEY STUDENTS, YOUR TECH CAREER STARTS HERE

GitHub Student Developer Pack

- No credit card required. Verified students have access to the GitHub Copilot Student plan.
- Get Free GitHub Pro, GitHub Copilot, Azure credits, and more!

<https://education.github.com/pack>

GitHub Monthly Enterprise Roundup (MER)

GitHub is shipping new features, product updates, and best practices faster than ever. To help you stay ahead, our Enterprise Advocacy team curates a monthly roundup – bringing you a concise, enterprise-focused summary of the most important updates you might have missed.

In these posts, you'll find a carefully selected list of key innovations, expert insights, and must-know resources—guided by feedback from GitHub's largest customers—to help your team innovate faster, boost productivity and enhance security.

Share with your teams and stakeholders so they can also get the most out of their GitHub experience.

Follow **GitHub Enterprise** on **LinkedIn** to be notified of each new post.

What's New with GitHub & GitHub Copilot

Dave Burnison

Sr. DevOps Advocate / GitHub

From one giant AI-generated PR to a reviewable stack

Stacked pull requests: decompose agent-generated work into small, dependency-ordered reviews

Coding agents default to shipping large, single-commit pull requests, which makes review painful even when the underlying code is solid.

Decompose, don't dump

Break an agent-generated feature into a dependency-ordered stack of small, single-concern pull requests.

Native to GitHub

Stack map for one-click navigation, CI on every layer, and `gh stack push / rebase / sync` from the terminal.

Better reviews, faster merges

Route each layer to the right owner — data, API, wiring, UX — instead of one sprawling 1,700-line diff.

One feature, four reviewable layers

L4 feat/grounded-ui

Product citation cards + UI states

L3 feat/chat-grounding

Chat answers from real product data

L2 feat/search-api

Validated `/api/products/search` endpoint

L1 feat/catalog-data

Typed catalog, seed data, data access

main · stack base

Read top-down for context. Review bottom-up to merge.

Model and agent choice, across every surface

Add an AI agent to your app with GitHub Copilot SDK

<https://gh.io/copilotsdk>

Documentation: <https://docs.github.com/en/enterprise-cloud@latest/copilot/how-tos/copilot-sdk>

GitHub Copilot App

It's a GitHub-native desktop experience for agentic development.

Each session has its own space: branch, files, conversation, and task state.

Work stays separated, even when you have more than one thing in motion.

<https://github.com/features/ai/github-app>

📁 GitHub Copilot App Canvases

Canvases are custom apps running inside of the GitHub Copilot app that the agent can control and are opened from a chat session. They can do everything a custom desktop application can do, with the added ability to communicate back to the chat. Anyone can build one just by asking the agent for a canvas in a chat session.

<https://docs.github.com/en/enterprise-cloud@latest/copilot/how-tos/github-copilot-app/working-with-canvas-extensions>

GitHub Copilot app Canvases

Canvases are custom apps running *inside of* the GitHub Copilot app that the agent can control and are opened from a chat session. They can do everything a custom desktop application can do, with the added ability to communicate back to the chat. Anyone can build one just by asking the agent for a canvas in a chat session.

Real world use cases:

- Custom UI for your agent/workflow: <https://youtu.be/wuNpyX20MmA?si=bSqzdHG9zsZf3zt0>
Take this and re-mix it
- SQLite browser: <https://x.com/burkeholland/status/2083264941348245579?s=20>
- Mobile Devices: <https://x.com/JamesMontemagno/status/2085081728142729261>
- Actions Hub: <https://awesome-copilot.github.com/extension/repo-actions-hub/>

 GitHub Copilot Skills

Take flight with GitHub Copilot. Explore how AI can supercharge your coding.

<https://learn.github.com/skills>

Validates the ability to design, build, evaluate, and manage AI agents across the software development lifecycle.

Why it matters

Proves a team can run AI agents in production SDLC workflows with GitHub as the system of record and control plane - reliability, safety, and velocity, not just experimentation.

Who should earn it

Intermediate level. Developers, DevOps and platform engineers, AI engineers, and architects building AI-powered developer experiences or embedding agents in their workflows.

What is measured

Agent architecture, tool use, memory and state, evaluation and tuning, multi-agent orchestration, guardrails and accountability.

Technical Research Project

 **Project HydraFusion: Frontier quality via multi-model orchestration** - GitHub's new Project HydraFusion hints at the next evolution of AI-assisted software development: instead of forcing developers to choose the “best” model, As the harness, Copilot dynamically orchestrates multiple models to draft, critique, revise, and escalate work behind the scenes, delivering frontier-level coding quality at significantly lower cost. In GitHub's benchmark testing, HydraFusion matched or exceeded leading single-model performance while reducing workflow costs by up to 67%, suggesting that future gains in developer productivity may come more from intelligent orchestration than from bigger models alone. If you are evaluating AI coding platforms, agentic workflows, or Copilot ROI, this *research preview* provides an early look at how multi-model systems could reshape the economics, quality, and scalability of enterprise software engineering. See also:

-  **Satya Nadella's comments on LinkedIn** - Super excited about HydraFusion in GitHub Copilot, and what it shows about the shift from model selection to model orchestration. By bringing together multiple models to plan, build, critique, and complete coding tasks, it can deliver outcomes at up to 67% lower cost. It's a great example of the value of a heterogeneous model ecosystem, and how we're continuing to advance the cost-to-outcome frontier.

-  **Introducing Project HydraFusion: multi-model orchestration in GitHub Copilot** (1:33) – Learn from Mario Rodriguez, GitHub Chief Product Officer about Project HydraFusion.
